# Resetting Critical Faults

Any unexpected faults of the system will create a "Critical Safety Reset" button. The affected zone must be reset via "Critical Safety Reset" button on the HMI. These resets are zone specific.

Any critical fault that keeps re-occurring must be reported to maintenance to fix the problem if ignored it may cause a unsafe situation.

STEP	ACTION
1	Visually check the system to ensure no one is inside the safety fence and everything looks in a fit state to run.
2	Click the "Safety System" button in order to bring up the safety devices overview screen. If a critical fault has occurred that zone button should turn red and say "critical fault" in the status description. From the safety overview tab click on the affect Safety Zone button which will bring up the tab for that zone.
3	Press the critical fault reset button in order to reset the fault.
4	Reset any affected safety zones. Note: the critical fault must first be reset on the HMI as per step 2 in order to be able to reset the safety zone.
5	Press Start All at the gate or HMI control panel.
